

Belting

MAXIMIZING PROFITABILITY WITH TOTAL CONTROL

Do you want complete control over your belting inventory? Can you track your entire inventory, from parent to scrap, while controlling the cost? Wouldn't it be great if there was distribution software that could handle most of your other needs and keep track of your belting inventory and profitability? Tribute is that software. With many features added specifically to serve the needs of belting distributors, Tribute is uniquely suited to serve your business.

Belt Tracking & Cost Control

- Slabs can be set up for each different type of material used and are stored by Inch (width) Feet (length) unit of measure for easier tracking of quantity and costing.
- Slabs are tracked by a system assigned number that follows cuts and remnants. Billing widths can be defined differently from cut widths.
- Have much better control of costs on the belts – know the quantity & size of inventory and scrap on hand. Can track back to the original piece for better cost control.
- Have specific costing on each belt so you can get the actual cost and profitability of each order because the system will roll up all additional products and/or services being applied to that orders such as v-guides, t-cleats, labor, burden, etc.

Slab Cuts

The slab map can identify when a cut has been allocated for a sales order with our Selected Cut feature. This allows both sales and warehouse staff to know the exact requirements on a particular slab. The Cut Line feature notifies the shop where the slab is to be cut – either to the right or left of the slab and prints on any slab work order.

Slit Lines

This feature alerts your shop to any necessary slit cuts to be taken in a slab. Prints on your work orders specific to each slab.

Bad Spots

Bad spots can be indicated at the time the slab is received. The system will not allow a cut to be made through a bad spot in the slab.

Improving Your Customer Service:

- In Tribute you can convert quotes into orders easily. If the customer orders just a few line items from the quote, the partial quote can be converted and the quote remains in history so you can convert the balance at a later date, track quotes, etc.
- Have a variety of options and fields to create and find P/N's: Customer P/N, Vendor P/N, BOM, repeat BOM's, short and long description
- Displays only the belt slabs that meet the customer's criteria and then identifies the maximum possible cuts per slab.
- Check the availability of product at time of order entry because you have a good visual and see if you have pieces big enough to sell.
- You can check the availability of product at any branch quickly and elect to ship from that location or do a stock transfer easily without double entry.
- Email and fax quotes, orders, acknowledgements and invoices right from Tribute. You have the option to send instantly or at scheduled transmission times (e.g. nightly invoicing, consolidating POs)
- You can enter an order for one material, then substitute a different material without cancelling and re-entering the order
- Customer service can view a customer's history easily – what they bought, what they paid, invoice history, Repeat BOM's

Equipment ID -

For customers that order items specific to a machine (or production line) or if you want or need to keep track of what items are sold for specific customer machines. You can also see how often the customer purchases items for a specific line or machine to assist them in their purchasing decisions

*Belting is a competitive and unique business that shares one thing with all other distributed items - the need to accurately price and maintain inventory levels. **With Tribute's unique Belting Module you have the power to maximize profits along with efficiency.***
